Project Proposal for NuCamp FullStack Bootcamp

Introduction

I recently viewed a company's website I use to work for. It was great company, but their website, www.foodequipmentservice.com, is very outdated, non-responsive and not very functional for the company or its clients.

I hope to bring the styling up to date and also the functionality to higher level of performance for both the company and their clients. To do this I will set the design to be simpler and more organized while bringing the site up to compliance with today's browsers and standards of html. Better forms, menus, and navigation will need to be added. Lastly the interaction between the company and their clients need to be modernized with the addition of customer log ins and the ability to see billing, work requests, and service history.

The list of features that will need to be included in this site are:

- Mobile first development
- Secure webpage
- User logins
- Forms for user sign ups
- Forms for service request
- Links to email and phone numbers to make it easier to dial from portable devices
- Stylish streamlined design

Some other websites that are available for companies in the same business include:

https://www.emrco.com

https://www.hobartcorp.com

https://elmerschultz.com

https://www.fastservinc.com

These other websites incorporate many features that I have for my idea of a design. I do not see any of them that allow their customers to interact with the site by logging on though. It seems like the sites just encourage people to submit forms or

call the numbers they have listed. Many of the sites also list the number and address multiple times on their page.
